16.30 Topic 11: Full-state feedback control

Full-state Feedback Controller • Assume that the single-input system dynamics are given by $\dot{x}(t) = Ax(t) + Bu(t)$ $y(t) = Cx(t)$ so that $D = 0$ • The multi-actuator case is quite a bit more complicated as we would have many extra degrees of freedom • Recall that the system poles are given by the eigenvalues of A

Lecture 9 - Implementing PID Controllers

Implementing a PID Controller Can be done with analog components Microcontroller is much more flexible Pick a good sampling time: 1/10 to 1/100 of settling time Should be relatively precise, within 1% - use a timer interrupt Not too fast - variance in Δt Not too slow - too much lag time Sampling time changes relative effect of P, I and D

Signal Filtering in PID Control - NTNU
